Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                    The present invention relates to methods and compositions for enhancing cardiac function in mammalian hearts by inserting transgenes encoding beta-adrenergic signalling proteins (beta-ASP) which increase beta-adrenergic responsiveness within the myocardium using in vivo gene therapy. The beta-ASPs of the invention include beta-adrenergic receptors (beta-AR), adenylylcyclases (also referred as adenylcyclase, adenylate cyclase and cAMP synthetase) and G-protein receptor kinase (GRK) inhibitors. The beta-ASP is used for enhancing cardiac function in mammalian hearts and for treating heart disease, especially congestive heart failure. The present CDNA sequence encodes human partial cardiac adenylcyclase VI (ACVI) isoform which is used for energing a third beta-ASP transgene, used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             240

from the present invention. The present invention describes a recombinant replication-defective viral particle (I) comprising a gene encoding a beta-adranegic signalling protein (beta-ASP) operably inked to a promoter. Also described are: (I) a recombinant pro-viral plasmid (Ia) comprising a gene encoding a beta-ASP, as above, operably linked to a promoter and further comprising a replication-defective viral genome; (2) a (mammalian) cell transfected with (I) or (Ia); an isolated polynucleotide comprising a sequence encoding a human adentylylcyclase isoform VI (AC-VI), or a variant having Ac activity; (4) a human AC-VI encoded by (3); (5) an isolated polynucleotide comprising the polynucleotide of (3); (1) can be used to form a comprising the polynucleotide of (3); (1) can be used to form a cardiac function in mammals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           GAACGCAATGGGCAGAAGCGTTCGCGGCGCCGTGGCACTCGGGCAGGTGGCTTCTGCACG 120

The beta-ASPs of the invention include beta-adrenergic receptors (beta-AR), adenylylcyclases (also referred as adenylycyclase, adenylate cyclase and GAMP synthetase) and G-protein receptor kinase (GRK) inhibitors. The beta-ASP is used for enhancing cardiac function in mammalian hearts and for treating heart disease, especially congestive heart and for the present DNA sequence encodes human cardiac adenylcyclase VI (ACVI) isoform which is used for generating

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         myocardium; gene therapy; beta-adrenegic receptor; beta-AR; adenylylcyclase; adenylate cyclase; cAMP synthetase; G-protein receptor kinase; GRK; heart disease; congestive heart failure; cardiac adenylcyclase VI; ACVI isoform; beta-ASP transgene; ss.
 to methods and compositions for enhancing
        cardiac function in mammalian hearts by inserting transgenes encoding beta-adrenergic signalling proteins (beta-ASP) which increase beta-adrenergic signalling proteins (beta-ASP) which increase gene therapy. The beta-ASPs of the invention include beta-adrenergic receptors (beta-AR), adenylylcyclases (also referred as adenylcyclase, adenylate cyclase and cAMP synthetase) and G-protein receptor kinase (GRX) inhibitors. The beta-ASP is used for enhancing cardiac function in mammalian hearts and for treating heart disease, especially congestive heart failure. The present DNA sequence encodes human cardiac adenylcyclase VI (AVCVI) isoform which is used for generating a fourth beta-ASP transgene, used in the exemplification

The present invention relates to methods and compositions for enhancing cardiac function in mammalian hearts by inserting transgenes encoding beta-adrenergic signalling proteins (beta-ASP) which increase beta-adrenergic responsiveness within the myocardium using in vivo gene therapy. The beta-ASPs of the invention include beta-adrenergic receptors (beta-AR), adenylylcyclases (also referred as adenylcyclase, adenylate cyclase and cAMP synthetase) and G-protein receptor kinase (GRK) inhibitors. The beta-ASP is used for enhancing cardiac function in mammalian hearts and for treating heart disease, especially congestive heart failure. The present colns sequence encodes human modified cardiac adenylcyclase VI (AVVI) isoform which is used for generating a beta-ASP transgene, used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               141

A canine heart cDNA library was constructed in lambda gill and was screened with a 970 bp Aatl-HincII fragment from type I adenylyl cyclase CDNA probe (encodes the first cytoplasmic domain of adenylyl cyclase, which has significant homology to other previously known types of adenylyl cyclase). One positive clone, of 5.4 kb was obtd. Positive colonies were subcloned into pucil and further subcloned and sequenced bidirectionally. The 5.4 kb clone was used to rescreen the library and on averlapping clone contg. the 5' end of the gene was isolated. Together the two clones cover the complete canine cardiac adenylyl cyclase gene. The gene is suspected of being involved in the regulation of cardiac function and it is thought that decreased activity of adenylyl cyclase in the heart may be a major factor in the development of heart failure. Thus the adenylyl cyclase gene is useful to screen cpds. which stimulate the activity

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AANY3059) that is expressed mainly in the heart and brain. hAC6 has a similar putative structure to other adenylyl cyclase (inc.), see a similar putative structure to other adenylyl cyclase isoforms. Use, like type V, is distinguishable in that it has a larger region. hAc6 cDNA was initially isolated from a human heart cDNA region. hAc6 cDNA was initially isolated from a human heart cDNA interpretation. HAC6 cDNA sequence. The invention relates to the hAc6 gene, methods for the recombinant production of purified hAc6 and center profiles against hAc6 and cortors, probes and host cells (especially HEK-293) transformed by genes encoding polypeptides having hAc6 activity, along with can be used as a tool to screen for agonists and antagonists that stimulate/inhibit hAc6. Such compounds have therapeutic utility in treating diseases caused by aberrant activity of this enzyme, a child thac6. Such compounds have therapeutic utility in the continuation of this enzyme, and diseases whose symptoms can be ameliorated by stimulating or activities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             61 GAACGCAATGGGCAGAAGCGTTCGCGGCGCCGTGGCACTCGGGCAGGTGGCTTCTGCACG 120

The present invention describes a method for examining ischaemic conditions, comprising measuring the expression levels of particular genes (I) in a test sample or determining the expression profile of a gene group in the sample comprising genes selected from (I). The method is useful for examining the ischaemic condition (e.g. compressive ischaemia, occlusive ischaemia or vasospastic ischaemia) by measuring expression levels of particular genes (ABI99202 to ABI9912, encoding the protein sequences in ABB57020 to ABB57374) or by determining the expression profile of a gene group comprising these genes. The expression levels or expression profiles produced by these genes are used as an indicator when screening for ischaemic condition-improving drugs or therapeutics for ischaemic clischaemic condition improving the preparent PGR primers for a mouse ischaemic condition related sequence, when
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Examining the ischemic condition (e.g. occlusive ischemia) by measuring expression levels of particular genes defined in the specification or by determining the expression profile of a gene group comprising these

```
A recombinant Adenylyl cyclase is described which lacks membrane bound domains. Separation and purification of the recombinant enzyme is much easier compared with wild type enzymes and the recombinant enzyme is more stable than the wild type enzyme which allows easier screening of compounds that stimulate and inhibit adenylyl cyclase activity. The recombinant adenylyl cyclase comprises a chimera of adenylyl cyclase comprises
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel soluble mammalian polypeptide composition comprising adenylyl cyclase activity for screening stimulators and inhibitors of adenylyl cyclase, is activated by Gsalpha

```
invention or a mimetic which antagonises or mimics an activity of a CRIMI polypeptide may be used in a method for modulating the biological activity of a polypeptide of the bone morphogenic protein (BMP) family. In this way they may be used to prevent or treat an eye disease, especially cataract formation. They may also be used to treat neurodegenerative diseases, renal and kidney disease, bone and tooth abnormalities, wounds and skin damage, e.g. by use of the nucleic acid in gene therapy by using antibodies directed against CRIMI polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to nucleic acids from human chromosome 2p21-16.3 and the encoded peptide (and mouse and chicken orthologues) that comprises a PGECCPLP group, an insulin-like growth factor binding protein (IGFBP)-like domain, cysteine-rich domains, an RGD (undefined) group and a transmembrane domain. The protein, e.g. CRIMI, interacts with peptides of the transforming growth factor superfamily. A composition comprising an expression construct comprising the nucleic acids of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              234445 CCCTACGGCCGCAGCTCCTCCTGCGCCCTCCTTCCGCCCGGACGCGGGAGTCCCCGCCC 234386

molecules. The sequences of the invention can be used in the treatment and diagnosis of various disorders including cardiovascular diseases such as atteriosclerosis, myocardial infarction and coronary arterial thrombosis, renal diseases such as diabetic nephropathy, muscular diseases such as hypertrophy, immune disorders such as immune complex nephritis, multiple sclerosis, cancer, sarcoidosis, nonarcoidotic pulmonary granulomatous diseases such as asbestosis and vascular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequence represents a DNA encoding an angiotensin converting enzyme splice variant (ACEV) polypeptide. The polypeptides of the invention include variants of granulocyte colony stimulating factor receptor, glucagon, interleukin 6, platelet-derived endothelial cell growth factor, cyclin-dependent kinase inhibitor 1C, cellular tumour antigen P53, and associated incleic acids are useful for identification of variant sequences and detection of candidate compounds capable of binding the
            granulocyte colony stimulating factor receptor; glucagon; hypertrophy; platelet-derived endothelial cell growth factor; cardiovascular disease; cellular tumour antigen P53; cyclln-dependent kinase inhibitor 1C; ds; vasoactive intestinal polypeptide receptor 2; arteriosclerosis; cancer; myocardial infarction; coronary arterial thrombosis; renal disease; multiple sclerosis; immune complex nephritis; deep vein thrombosis; nonarcoidotic pulmonary granulomatous disease; endothelial abnormality;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel alternative splicing variants e.g. variant of angiotensin converting enzyme (ACEV), useful in identifying candidate compounds capable of binding to the variant and to detect anti-variant antibodies

                                                                                                                                                                                                                                                                                                             óλ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        antipsoriatic; attiparkinsonian; noctropic; neuroprotective; osteopathic; anticonvulsant; antiarthritic; immunosuppressant; immunostimulant; cardiant; thrombolytic; coagulant; vasotropic; antidabetic; hypotensive; dermatological; immunosuppressive; antidabeterial; antiviral; antifungal; antirheumatic; antithyroid; and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        δ
       The nucleotide sequence of the novel N-methyl-D-aspartate (NMDA)

receptor 2C (NMDAR2C) gene clone NMDA24. This clone covers bases

861-4068 of the complete NMDAR2C gene (AAQ79372) with an insertion of 11

bp between bases 1300-1 and an insertion of 24 bp between bases 2350-1.

The 11 bp insert adds an extra 3 a. to the peptide sequence but causes

a reading frame shift which terminates the peptide at residue 494 of the

NMDAR2C sequence. The NMDA receptor contains two subunits: subunit R1

(AAQ79370) and subunit R2 selected from the subunits 2A (AAQ79375), 2B

(AAQ79377), 2C and 2D (AAQ79378). The receptor forms part of a family of

NMDA receptors which have cation-selective channels and bind quitamate

and NMDA. The NMDAR2C gene was obtained by amplifying cDNA derived from

human brain tissues with primers corresponding to sequences in the rat

NMDAR2A receptor DNA and using the resultant fragments as probes to

screen a cDNA library derived from human hippocampal RNA. 4 basic clones

were isolated: NMDA21 (AAQ79399), NMDA22 (AAQ79401)

and NMDA26 (AAQ79402). The clones are thought to be splice variants of

each other. Based on the sequence of the 4 clones, a series of variants

(AAQ79403-7) of the NMDAR2C receptor were constructed. The expression of

the genes allows the reconstruction of the NMDA receptor. The complete

the teceptor can be used to identify compounds which bind or are antagonistic
                                                                                                                                                                                                                                                                                                                                                                                        ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         N-methyl-D-aspartate; receptor; human; NMDA; cation-selective; channel; glutamate; hippocampus; rat; pcDNA1; NMDA receptor; antagonist; ds.

The nucleotide sequence of the novel N-methyl-D-aspartate (NWDA)

receptor 2C (NWDAR2C) gene clone NWDAR2C-delta15-delta51. This clone
contains bases 1-1959, 1975-2350 and 2402-4068 of the complete NWDAR2C
sequence (AAQ79372). The variant differsifrom the full length sequence by
a 15 bp deletion of bases 1960-74 and a 51 bp deletion of bases
2351-24401. A series of variants (AAQ79403-7) of the NWDAR2C receptor
were constructed, by recombination, based on the sequence of the 4 basic
clones: NWDA21 (AAQ79399), NWDA22 (AAQ79400), NWDA24 (AAQ79401) and
NWDA22 (AAQ79377), and subunit R2 selected from the subunits 2A (AAQ79375), and subunit R2 selected from the subunits 2A (AAQ79375), and LAAQ79378). The receptor forms part of a family of
NWDA receptors which have cation-selective channels and bind glutamate
and NWDA receptor. The complete receptor can be used to identify compounds
which bind or are antagonistic to the human NWDA receptor.
                                                                                                                                                          N-methyl-D-aspartate; receptor; human; NMDA; cation-selective; channel; glutamate; hippocampus; rat; pcDNAl; NMDA receptor; antagonist; ds.
                                                                                                                                                                                                                                                       /*tag= a

Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     MO 63108 USA
